✉️ work.catsonis@gmail.com / TG: arti_alex / LinkedIn: artialex

Senior Software Engineer / Technical Lead with 12+ years of experience building scalable web applications and improving engineering processes. Strong background in JavaScript / TypeScript, React ecosystem, frontend architecture, developer experience, and cross-team collaboration. Focused on creating maintainable systems, improving development workflows, and driving technical initiatives that increase team productivity and product quality.

Particularly interested in interactive experiences, data visualization, and 3D graphics technologies.

Recent Experience

ROGII 2024 — 2026

Senior Software Engineer / Technical Lead

Built complex interactive visualizations and data-driven interfaces using D3, SVG, and Three.js, including features such as fullscreen mode, handling real-time and historical datasets, advanced UI interactions (windows, panes, drag-and-drop), and virtualized data tables.

Developed and maintained 4 reusable pluggable widgets (out of 10+) for DrillSpot, the company's flagship web application, using SVG/D3 and Three.js depending on visualization and performance requirements.

Established a standardized approach for implementing new data pipelines and visualization flows (data collection → processing → filtering → presentation), utilizing algorithms such as sweep line for geometry-related tasks.

Led technical discussions and helped drive architectural and engineering decisions across the team through approaches such as ADRs.

Initiated and led multiple engineering improvements, including migration from Webpack to Rspack (improving build performance by 10x and significantly enhancing developer experience), and migration from TypeScript 4 to TypeScript 5. Drove adoption of a modular architecture approach to improve maintainability and reduce complexity in a growing codebase.

Contributed to development and evolution of the company UI kit, improving consistency and increasing development efficiency.

Introduced Storybook to improve component isolation, documentation, bug detection, and UI development workflows

Road.Travel 2022 — 2024

Senior Software Engineer / Technical Lead

Contributed across both frontend and backend development, with a primary focus on frontend architecture and GraphQL-based systems.

Designed, developed, and delivered user-facing features for a large React application built around GraphQL, using Next.js, urql/Relay, and related frontend technologies.

Built multiple dynamic landing pages integrated with backend-driven content using Qwik, Tailwind, and Payload CMS. Supported and maintained a legacy Angular application while contributing to the evolution of the newer React platform. Solely developed a standalone white-label version of the application for an automotive partner.

Rebuilt the Map Search module from scratch, improving maintainability and creating a more scalable and reusable foundation for future development.

Introduced development standards and tools such as Prettier, end-to-end testing, and improved CSS practices to increase consistency and enhance developer experience.

Built several Playwright test suites that improved bug detection before releases, particularly for authentication flows.

Adalisk 2021 — 2022

Senior Software Engineer

Worked as the only web developer in a C++-focused team, collaborating closely on product development while owning all web application development.

Developed a customer-facing application from scratch for viewing and interacting with digital 3D jaw models using Three.js and React Three Fiber.

Built a set of internal configuration management tools from scratch for the core C++ application using Blueprint.js.

Previous Experience

2014 — 2021

JavaScript Engineer

Worked across various Russian telecom, e-commerce, finance, real estate, education, and startup products, contributing to both customer-facing and internal systems.

Developed frontend applications and services using React, Vue.js, Nuxt.js, Node.js across multiple industries.

Worked on projects involving real-time communication and collaboration features using technologies such as WebSockets and WebRTC.

Participated in (and often initiated) architecture modernization initiatives, including migration from layer-based structures toward more modular and scalable approaches, microservices adoption, and legacy system modernization.

Built and maintained widgets, frontend services, and supporting tools for internal and external products.

Introduced and improved development processes through CI/CD setup, automated testing, developer tooling, and workflow improvements.

Worked with multiple testing technologies including Jest, Cypress, Selenium, webdriver.io, Protractor, and Python-based test frameworks.

Mentored developers, led technical discussions and retrospectives, and collaborated closely with designers and cross-functional teams.

Improved team communication and productivity through process changes, automation, and internal tools.
